

## **FINAL REPORT**

### **2019-20 Deer Management Program**

**Iowa City, Iowa**

**by**

**White Buffalo, Inc.**

**17 March 2020**

#### **Site Description and Management History**

Iowa City contains a matrix of suburban/commercial development, agricultural fields, parks and open grasslands. As a result of no legal hunting opportunities and fertile soils, the deer population had increased to a level incompatible with some land uses and human activities. Although deer physical condition is not an issue, there is concern regarding deer/vehicle collisions, disease transmission, and damage to garden and landscape plantings.

Deer population reduction efforts were implemented in 1999-2002 and 2004-2009. After a decade of no deer management a comprehensive deer management plan was implemented under the authorization of the Iowa Department of Natural Resources. This plan includes one year of sharpshooting effort and 4 years of bow hunting.

#### **Deer Management Program Overview**

Pre-baiting was conducted from 11 November – 1 December 2019 for Phase 1 of operations and 30 January 2020 – 16 February 2020 for Phase 2. Deer removal activities occurred from 2-22 December 2019 during the first phase of operations and 23 February - 14 March 2020 for Phase 2. Thirty-eight days of fieldwork were required to achieve the harvest of 500 deer. No management activities occurred on 7 - 8 December 2019 at the request of the deer processor. Non-conducive weather prevented operations on 5 and 9 March 2020.

#### **Field Methods**

We followed the operations protocol outlined in the contract. Forty-four bait sites were selected throughout the area of operation. Bait sites were shut down during the program as productivity declined or initial pre-baiting activity demonstrated little deer activity. Seven sites were not utilized during operations due to redundancy or lack of consistent deer activity.

Deer were shot on a first opportunity basis. This means that deer were shot only when, 1) a safe opportunity presented itself, and 2) maximal harvest efficiency would be achieved. Carcasses were then tagged and delivered to Ruzicka's Meats for processing.

### **Harvest Demographics**

The entire data set generated from harvested deer is represented in the spreadsheet entitled "City of Iowa City – Deer Harvest by Date: 2 - 22 December 2019 and 23 February – 14 March 2020 (Appendix A). We harvested 299 females (60%) and 201 males (40%). The overall harvest demographics are summarized in Table 1. We harvested 146 (29%) juveniles and 354 (71%) adults.

**Table 1.** Age class and sex distribution of deer harvested in Iowa City, Iowa from 2–22 December 2019.

| AGE      | # MALE (%) | # FEMALE (%) | # COMBINED |
|----------|------------|--------------|------------|
| Juvenile | 69 (14%)   | 73 (15%)     | 146 (29%)  |
| Adult    | 130 (26%)  | 224 (45%)    | 354 (71%)  |

### **Harvest by Deer Management Zone**

To allow for a more comprehensive population management program, we summarized all the harvest data by management zone (Table 2). Zone A covers areas within the city limits north of I-80. Zone B was delineated on the west and south by the Iowa River, on the east by Dubuque Street and on the north by I-80. Zone C was located east of Dubuque Street, south of I-80 and northwest of Dodge Street. Zone D included land southeast of Dodge Street, north of Rochester Avenue and west of Scott Boulevard including the Ralston Creek corridor; Zone E covered the area east of the Iowa City airport, south of Route 6 and west of Sycamore Road. Zone F consisted of all areas west of the Iowa River and north of Melrose Avenue to the County Line (including University of Iowa property). In total, the program was conducted in approximately 11.5 mile<sup>2</sup> of the city. The most productive sites were within Zones C and D, where individual sites accounted for 33 and 59 deer respectively (18.4% of the total harvest). For more comprehensive refinement Zone D can be divided by harvest east/west of 1<sup>st</sup> Avenue. We harvested 107 deer east of 1<sup>st</sup> Avenue and 103 in the western section.

**Table 2.** Ten-year comparison of harvest data by deer management zone. (See Zone map on page 18)

| ZONE         | 1999-2000  | 2001       | 2002       | 2004       | 2005       | 2006       | 2007       | 2008      | 2009      | 2019/2020  |
|--------------|------------|------------|------------|------------|------------|------------|------------|-----------|-----------|------------|
| A            | 15         | 2          | 27         | -          | -          | -          | -          | -         | -         | 8          |

| <b>Total</b> | <b>360</b> | <b>340</b> | <b>250</b> | <b>200</b> | <b>154</b> | <b>150</b> | <b>199</b> | <b>89</b> | <b>69</b> | <b>500</b> |

### **Discussion**

Removal efforts concluded with very little disruption and a high level of success. Good weather during the program and high deer densities contributed to robust deer activity at most of the bait sites.

Unusually mild weather during end of both phases of management efforts decreased bait site activity to a minor degree, but not enough to be significantly detrimental to overall productivity. Based on harvest results per zone and observations in the field it is likely the actual deer density, in the area where the population estimate was conducted, was over 130 deer/mile<sup>2</sup> pre-implementation in 2019. With two years of additional recruitment since the 2017 population estimate, this was not unexpected. We harvested 113 deer/mile<sup>2</sup> were removed in this 3 mile<sup>2</sup> area (340 deer).

Harvest numbers support the high-end range of the population estimate conducted in 2017. Adult male population demographics were in line with what we have seen in other non-hunted populations, 30% in both Cincinnati, OH and San Jose, California, and less than what was indicated during the 2017 camera survey (42%). The bias adjustment to the 2017 population estimate was justified. The overall deer population expansion from 2017 to 2019 indicates a population growth rate of ~30%. The low doe/fawn ratio in the harvest result is indicative of harvest selection preference for adult females.

Two areas of town presented management challenges due to lack of access or absence of suitable shooting locations. The portion of the city south of I-80, east of Dodge, west of the municipal line and north of Scott Boulevard will show only minor reductions in the deer population. This portion of the city is owned by ACT, Inc. and they have chosen to not cooperate with the deer management program. They are the single largest landowner within the municipality and their property is in the area with the highest deer densities. We accessed some of the deer in this area on adjoining properties, but the large contiguous nature of their property holdings limited the effectiveness of our management efforts. At the conclusion of sharpshooting activities, it is likely that 75-100 deer still reside on ACT property. The other area of concern is near of the junction of 1<sup>st</sup> Avenue and Rochester Avenue. Restrictions to firearms discharge in the areas surrounding Regina Catholic Education Center precluded sharpshooting activities from taking place in Hickory Hill Park within 1000' of the school zone boarder. In addition, lack of access to suitable sharpshooting sites on private property near this location has left this area unimpacted by deer management activities. Numerous deer can often be seen crossing Rochester Avenue into the neighborhoods south of Regina property, contributing to an elevated risk of deer vehicle collisions.

Recreational feeding of deer by Iowa City residents impacted the overall efficiency and harvest totals of the 2019/2020 deer management program. Feeding of deer is pervasive throughout the community. Numerous management sites were detrimentally impacted by proximate residents feeding. Areas near Oakland Cemetery were especially deleterious. This very same topic was first mentioned two decades ago in the Iowa City Deer Management Report from 2000/2001. Feeding of deer contributes to habitat and landscape degradation, habituation to humans, disease transmission, and alteration of normal behavioral patterns (Inslerman et al. 2006). To prevent furtherance of these issues Iowa City should consider implementing a deer feeding ordinance. This is especially important considering the expansion of Chronic Wasting Disease (CWD) within Iowa. While all the deer tested in conjunction with the Iowa City Deer Management program tested negative for CWD, results from statewide testing by the Iowa Department of Natural Resources found the expansion of the disease into 4 new counties during the 2019 deer season (Decatur, Fayette, Winneshiek, and Woodbury).

While there is no population estimate to substantiate our assumption, it is believed that deer densities are now at or below 25 deer/mile<sup>2</sup> throughout Iowa City. Please note that these numbers are pre-fawning with a predicted increase in May/June. Moving forward, the archery program will have to harvest a minimum of ~55 deer annually to maintain the current deer population densities across the 8.3 mile<sup>2</sup> management area. Outside the management area deer are present in some of the highly developed neighborhoods where traditional deer management techniques (hunting) as well as non-traditional

sharpshooting techniques cannot address the population based on safety and discretion concerns. If deer population reductions are desired in these neighborhoods, then the only options available are either trap/capture and euthanize or trap/capture and sterilize. Left unmanaged, these populations will continue to grow and cause conflict.

We would like to thank Ruzicka's Meat Processing and all the city staff whom have assisted during the sharpshooting efforts.
